Supabase

Re: Senior Data Engineer

I am excited to apply for the Senior Data Engineer role at Supabase. With 15+ years of experience owning data end-to-end — from raw ingestion through ETL pipelines, modeling, and business-facing analytics — across insurance, banking, and healthcare, I am confident I can contribute meaningfully to your Data team from day one.

Throughout my career I have consistently operated across the full data stack rather than a single layer. At Wells Fargo I owned AML remediation pipelines from Hadoop/Hive/Dremio extraction through SAS ETL to regulatory artifact delivery, serving as the go-to engineer for complex technical challenges. At AIG I built the ETL foundation for the entire Global Actuarial Pricing department, ingesting data from mainframe, DB2, SQL Server, and Oracle. I have strong SQL skills, solid Python experience, and hands-on work with Snowflake, Databricks, PySpark, and cloud environments (GCP, AWS, Azure). I am also actively integrating AI tooling — including LLM-assisted coding and n8n-based Gen AI workflows — into my day-to-day work, while keeping correctness and ownership firmly in my own hands, which aligns directly with how Supabase approaches AI-first engineering.

I took a brief break from work for health reasons, and I am now fully ready and excited to return. I come back energized, current on modern data tooling, and eager to tackle a high-ownership role like this one — building systems designed to scale 10x and delivering analysis that drives real business decisions.

Supabase's open-source-first, async, fully remote culture is exactly the kind of environment where I do my best work. I would love the opportunity to speak further about how my background aligns with what the Data team is building. Thank you for your consideration.

Sincerely,

José R. Sousa
